EXECUTIVE SUMMARY

- **Participants:** 35 university students (aged 18-23), mostly male, third-year, IIT, DU.
- **Key Findings:**
 - **Academic Pressure:** Major stressor despite <3 hours of daily academic work. Leads to skipped meals/sleep and feelings of being overwhelmed.
 - **Mental Health Issues:** Anxiety, depression, imposter syndrome prevalent; family expectations & social media add stress.
 - **Coping & Help-Seeking:** Students use music, exercise, gaming but avoid professional help due to stigma.
 - **Technology Impact:** 2-4 hours/day on social media worsens stress & sleep.
 - **Institutional Support:** Mixed feedback; students want structured counseling & faculty awareness.
- **Recommendations:** Balanced workload, better counseling, mental health training, digital wellness, and community-building initiatives.

INTRODUCTION

This report analyzes survey data from 35 university students, focusing on academic stress, technology use, coping strategies, and institutional support. It reveals the significant impact of academic pressure, family expectations, and digital habits on mental well-being, highlighting gaps in support systems. The findings align with global research and emphasize the need for culturally sensitive, integrated interventions to create a healthier academic environment and better support students' mental health.

METHODOLOGY

- **Approach:** Survey-based study on student mental health.
- **Participants:** 35 IIT, DU students (aged 18-23, mostly male, third-year).
- **Data Collection:** Anonymous online questionnaire with multiple-choice, Likert scale, and open-ended questions.
- **Focus Areas:** Academic pressure, mental health indicators, coping strategies, technology use, and institutional support.
- **Analysis:** Statistical trends and thematic analysis.
- **Limitations:** Small sample size, self-reporting biases.
- **Future Scope:** Broader participant pool for more generalizable findings.

FINDINGS

Mental Health Trends & Key Stressors

- Demographics: 70% male, 30% female; 60% aged 18-23.
- Mental Health Scores: Average 5.8/10; 15% rated critically low (1-3), 30% rated good (8-10).
- Top Stressors:
 1. Academic Pressure: Strongest negative correlation with mental health (-0.72).
 2. Family Expectations: High pressure linked to 40% higher anxiety rates (-0.65 correlation).
 3. Technology Use: More than 4 hours of daily social media use linked to lower scores (-0.48 correlation).

FINDINGS

How would you rate your current mental health on a scale of 1 to 10?

35 responses

Fig: Mental health score result

FINDINGS

Coping Strategies & Support Systems

- Coping Mechanisms: Music, exercise, gaming popular, but professional help rarely sought.
- Social Support Impact:
 - Strong support systems → higher mental health scores (7.2 vs. 4.5).
 - Peer relationships are beneficial but can also cause stress through competition.
- Cultural Factors:
 - Religious/spiritual engagement linked to better mental health (6.8 vs. 5.2).
 - Cultural norms influence help-seeking behaviors, especially in collectivist backgrounds.

FINDINGS

Fig: Coping strategies

FINDINGS

Academic & Institutional Factors

1. Academic Pressure & Health:

- 75% skip meals or sleep for deadlines → 30% higher anxiety risk.
- Rigid policies (attendance, deadlines) increase stress.

2. Institutional Support Gaps:

- 80% willing to attend mental health workshops, but only 15% use existing services.
- Flexible academic policies and structured counseling improve outcomes.

FINDINGS

Have you ever skipped meals or sleep due to academic deadlines?

35 responses

Fig: Number of students skipping meals due to academic stress

If given the option, would you attend mental health workshops regularly?

35 responses

Fig: Number of students wanting to attend mental health workshop

FINDINGS

Technology & Future Concerns

- Digital Wellness:
 1. "Tech fatigue" from excessive platform use adds stress.
 2. Screen time before bed disrupts sleep, worsening mental health.
- Career & Financial Anxiety
 1. Final-year students report heightened stress over job prospects and internships
 2. First-generation students show resilience but greater financial worries.
- Future Recommendations:
 1. Integrated academic and mental health support.
 2. Digital wellness programs.
 3. More inclusive and accessible institutional resources.

RECOMMENDATIONS

- ◆ Mental Health Resource Center – Provides academic & mental health support with flexible in-person & virtual options.
 - ◆ Academic Policy Reform – Flexible deadlines, balanced assessments, and a mid-semester "Wellness Week."
 - ◆ Digital Wellness – Screen time guidelines, simplified learning platforms, and a Digital Wellness Coordinator.
 - ◆ Peer Support Networks – Structured mentoring programs to foster collaboration and mental health awareness.
 - ◆ Financial Support – Expanded work-study, emergency aid, and accessible mental health services.
- 

CONCLUSION

1. Multiple Factors: Academic, social, and personal issues impact mental health, with academic pressure as a major stressor.
2. Holistic Support: Effective interventions need to address individual and institutional factors, integrating mental health into academics.
3. Access Barriers: Support services improve outcomes, but awareness, accessibility, and cultural barriers limit use.
4. Prevention Focus: Early resilience and coping skills, embedded in the curriculum, are key to long-term success.
5. Institutional Commitment: Mental health is critical for academic success, requiring stakeholder collaboration.
6. Continuous Improvement: Regular assessment, adaptation, and investment ensure long-term effectiveness.
7. Shared Responsibility: Mental health is a collective effort, needing ongoing community collaboration.

Impact: Investing in mental health enhances academic performance, retention, and institutional success.

APPENDICES

Appendix A: Survey Methodology

- Survey Distribution Methods
- Response Rate Analysis
- Data Collection Period
- Validation Methods
- Question Types and Response Formats
- Data Analysis Tools Used

Appendix B: Detailed Statistical Tables

- Complete Demographic Breakdown
- Cross-tabulation of Key Variables
- Correlation Matrices
- Chi-square Test Results
- Regression Analysis Results

APPENDIX C: SURVEY INSTRUMENT

- COMPLETE QUESTIONNAIRE
- SCORING METHODS
- VARIABLE DEFINITIONS
- SCALE VALIDATIONS

APPENDIX D: RAW DATA VISUALIZATIONS

- MENTAL HEALTH SCORE DISTRIBUTIONS
- ACADEMIC PRESSURE TRENDS
- TECHNOLOGY USAGE PATTERNS
- SUPPORT SERVICE UTILIZATION RATES
